Revision/Draft

associated with the motions of particles (objects) and energy associated with the relative position of particles (objects)

- **HS-ETS1-3** - Evaluate a solution to a complex real-world problem based on prioritized criteria and trade-offs that account for a range of constraints, including cost, safety, reliability, and aesthetics, as well as possible social, cultural, and environmental impacts
- **CCSS.ELA-LITERACY.RST11-12.3** - Follow precisely a complex multistep procedure when carrying out experiments, taking measurements, or performing other technical tasks; analyze the specific results based on explanations in the text
- **CCSS.ELA-LITERACY.RST11-12.4** - Determine the meaning of symbols, key terms, and other domain-specific words and phrases as they are used in a specific scientific or technical context

radiation within that system. That there is a single quantity called energy is due to the fact that a system's total energy is conserved, even as, within the system, energy is continually transferred from one object to another and between its various possible forms. (HS-PS3-1),(HS-PS3-2)

- At the macroscopic scale, energy manifests itself in multiple ways, such as in motion, sound, light, and thermal energy. (HS-PS3-2) (HS-PS3-3)
- These relationships are better understood at the microscopic scale, at which all of the different manifestations of energy can be modeled as a combination of energy associated with the motion of particles and energy associated with the configuration (relative position of the particles). In some cases the relative position energy can be thought of as stored in fields (which mediate interactions between particles). This last concept includes radiation, a phenomenon in which energy stored in fields moves across space. (HS-PS3-2)

Revision Draft

related to grades 11-12 texts and topics

- **PS3.B: Conservation of Energy and Energy Transfer**
- Conservation of energy means that the total change of energy in any system is always equal to the total energy transferred into or out of the system. (HS-PS3-1)
- Energy cannot be created or destroyed, but it can be transported from one place to another and transferred between systems. (HS-PS3-1),(HS-PS3-4)
- Mathematical expressions, which quantify how the stored energy in a system depends on its configuration (e.g. relative positions of charged particles, compression of a spring) and how kinetic energy depends on mass and speed, allow the concept of conservation of energy to be used to predict and describe system behavior. (HS-PS-1)
- The availability of energy limits what can occur in any system. (HS-PS3-1)

Revision/Draft

Acquisition

Students will know...

- Momentum is defined for a particular frame of reference; it is the mass times the velocity of the object. (HS-PS2-2)

Students will be skilled at...

- Calculate the amount of work performed in a process and indicate if it is positive or negative

- Work is a transfer of energy between systems.
- The total momentum and energy of a system is conserved.
- An unbalanced force on an object produces a change in its momentum.
- Energy is a quantitative property of a system that depends on the motion and interactions of matter within that system. (HS-PS3-2)
- At the macroscopic scale, energy manifests itself in multiple ways, such as in motion, sound, light, and thermal energy. (HSPS3-2) (HS-PS3-3)
- In some cases the relative position energy can be thought of as stored in fields (which mediate interactions between particles). (HS-PS3-2)
- Energy cannot be created or destroyed, but it can be transported from one place to another and transferred between systems or converted to less useful forms (e.g. thermal energy). (HS-PS3-4)
- Kinetic energy of a system depends on mass and speed.
- The availability of energy limits what can occur in any system. (HS-PS3-1)
- Power is the rate at which energy is transformed.

- Determine the gravitational potential energy of an object based on its position in a gravitational field.
- Determine the kinetic energy of an object or system.
- Apply energy conservation in order to solve problems for various quantities (e.g. speed, height of object)
- Calculate the momentum of an object or system
- Classify collisions between objects or systems as perfectly inelastic or elastic.
- Determine if the kinetic energy of a system is conserved during a collision.
- Apply the impulse-momentum theorem in order to solve problems.
- Apply the work-energy theorem in order to solve problems.
- Evaluate collision scenarios and offer ways to decrease or increase impact force depending for each situation.

domain-specific words and phrases as they are used in a specific scientific or technical context related to grades 11-12 texts and topics

- **CCSS.ELA-LITERACY.RST11-12.7** - Integrate and evaluate multiple sources of information presented in diverse formats and media in order to address a question or solve a problem
- **CCSS.ELA-LITERACY.RST11-12.9** - Synthesize information from a range of sources into a coherent understanding of a process, phenomenon, or concept, resolving conflicting information when possible

energy stored in the field is changed. (HS-PS3-5)

- Newton's law of universal gravitation and Coulomb's law provide the mathematical models to describe and predict the effects of gravitational and electrostatic forces between distant objects. (HS-PS2-4)

- Predict and explain why voltage drops across each component in parallel and series circuits.
- Explain why any resistive element dissipates energy by heating the resistor.
- Determine the equivalent resistance of series circuits and parallel circuits.
- Calculate the power in any resistive circuit element
- Explain that moving charge is the source of all magnetic fields and moving charge may be subject to forces of existing magnetic fields.
- Explain the conditions when changing magnetic fields can create electric current flow in conductors.

Revision/Draft

Unit 3: Electric and Magnetic Phenomena - Stage 2 – Evidence

Code	Evaluative Criteria	Assessment Evidence
M, T	Modified school wide rubric	<p>PERFORMANCE TASK(S): <i>Students will show that they really understand evidence of how much electric power is used by common household devices</i></p> <p>Background/Purpose: Every appliance in your home uses electricity when it is “on”. Some appliances turn on automatically, some you turn on yourself. When the appliance is turned on, electric current flows through its wiring and supplies the energy needed by the device. Each appliance has its own power rating which can be used to calculate how much electricity is being used by that appliance. Also, your home has an electric meter which measures the amount of energy, in kilowatt hours (kWh), your family uses in a given amount of time. The electric company charges you for the number of kilowatt hours you’ve used based on the cost of each kilowatt hour and the delivery charges associated with getting that electricity to your home.</p> <p>Goal: You will collect appliance usage data from your home over a total of 24 hours (can be all at once, or broken into smaller periods of time based on your schedule) and use that data to calculate how much you are contributing to your household’s electric bill each month. You will then reflect on your electricity consumption and come up with some strategies or steps you can take to reduce the amount of electricity you consume.</p> <p>Project Requirements: <i>The project will contain the following components:</i> <i>Initial Data Collection</i> - use the electricity usage journal sheet to record the appliances you use on a regular basis, each appliance’s electricity usage (Wattage), the estimated amount of time each appliance was running and the number of Watt-hours the electric company would bill you for each appliance. <i>Data Analysis</i> - you will then calculate the cost of your energy usage (both energy AND delivery charges) <i>Reflection</i> - once you’ve determined how much your electricity cost, reflect on the following questions: -Of the appliances or devices you used, were any left plugged in? Do these devices still use electricity when plugged in but are turned “off”? Did you account for this “phantom energy” in your analysis? - Do you think you could reduce the amount of electricity you use? How? What changes could you make to save money on your electric bill?</p>

Revision Draft

		-Did anything surprise you in your analysis? Do you use a lot more electricity than you thought? Do you use less than you thought?

Revision/Draft

- Temperature of an ideal gas is a measure of the average kinetic energy of its molecules.
- Naturally, all gases, liquids and solids expand as they are heated.
- Heat is energy that is transferred from one system to another by means of conduction, convection, or radiation.
- Specific heat is a material property that describes the energy required to raise an object's temperature or the amount of energy released by that object as it cools.
- During phase transitions, heat is absorbed or released without changes in temperature (latent heat).

- Calculate the specific heat of an unknown material by using the specific heat of water as a control.
- Be able to identify the modes of heat transfer as conduction, convection, or radiation given specific examples (ex: roasting a marshmallow on the coals of a fire)
- Give examples of when thermal expansion has to be accounted for in engineering designs
- Explain the ramifications of solid state heat flow rates as a function of temperature during cooking
- List and explain the major ways society transfers energy into forms we use and the resulting human and global ramifications
- Explain how air conditioners and heat pumps work to force heat flow in the desired direction while reconciling with the laws of thermodynamics that state heat flows from the hotter to the cooler, energy is conserved and entropy is increased in a closed system

Unit 5 Heat and Thermodynamics Stage 2 – Evidence

Code	Evaluative Criteria	Assessment Evidence
T, M	Lab report	PERFORMANCE TASK(S): <i>Students will show that they really understand evidence of...</i> Heat Transfer lab Role: Engineering student Audience: Engineering Supervisor, University of New Haven, West Haven, CT Format: Formal lab report Task: Explain how thermal energy can be transferred between parts of a system which are in thermal equilibrium with each other.
A,M,T	Lab Reports	
M,T	Questioning of students	
A,T	Practice problems	
A,M	Summative Assessments	

Revision/Draft

Unit 5 Heat and Thermodynamics Stage 3 – Learning Plan

<i>Pre-Assessment</i>		
	<i>KWL Charts</i> <i>Brainstorming at the beginning of a unit mind / concept mapping</i> <i>Formal pre-assessment to match the post assessment - optional</i>	
Code	Summary of Key Learning Events and Instruction <i>Student success at transfer meaning and acquisition depends on...</i>	Progress Monitoring
M, T	Heat Transfer lab, Honors version - explore experimentally how thermal energy moves between systems H, E, R, E2, O	<ul style="list-style-type: none"> • Quizzes on content • Lab report write-ups • Questions on activities • Questioning for comprehension • End of unit assessment/ post-test
M, T	Energy Skate Park Friction, Honors version - Examine the effects of thermal energy in the context of the laws of thermodynamics W, H, R, T	
A, M	Summative assessment E2
